转 ffmpeg源码分析：transcode_init()函数

2013年09月20日 17:36:06 阅读数：6776

transcode_init()函数是在转换前做准备工作的.此处看一下它的真面目,不废话,看注释吧:

```cpp
//为转换过程做准备
static int transcode_init(OutputFile *output_files,
        int nb_output_files,
        InputFile *input_files,
        int nb_input_files)
{
    int ret = 0, i, j, k;
    AVFormatContext *oc;
    AVCodecContext *codec, *icodec;
    OutputStream *ost;
    InputStream *ist;
    char error[1024];
    int want_sdp = 1;

    /* init framerate emulation */
    //初始化帧率仿真(转换时是不按帧率来的,但如果要求帧率仿真,就可以做到)
    for (i = 0; i < nb_input_files; i++)
    {
        InputFile *ifile = &input_files[i];
        //如果一个输入文件被要求帧率仿真(指的是即使是转换也像播放那样按照帧率来进行),
        //则为这个文件中所有流记录下开始时间
        if (ifile->rate_emu)
            for (j = 0; j < ifile->nb_streams; j++)
                input_streams[j + ifile->ist_index].start = av_gettime();
    }

    /* output stream init */
    for (i = 0; i < nb_output_files; i++)
    {
        //什么也没做,只是做了个判断而已
        oc = output_files[i].ctx;
        if (!oc->nb_streams && !(oc->oformat->flags & AVFMT_NOSTREAMS))
        {
            av_dump_format(oc, i, oc->filename, 1);
            av_log(NULL, AV_LOG_ERROR,
                   "Output file #%d does not contain any stream\n", i);
            return AVERROR(EINVAL);
        }
    }

    //轮循所有的输出流,跟据对应的输入流,设置其编解码器的参数
    for (i = 0; i < nb_output_streams; i++)
    {
        //轮循所有的输出流
        ost = &output_streams[i];
        //输出流对应的FormatContext
        oc = output_files[ost->file_index].ctx;
        //取得输出流对应的输入流
        ist = &input_streams[ost->source_index];

        //attachment_filename是不是这样的东西:一个文件,它单独容纳一个输出流?此处不懂
        if (ost->attachment_filename)
            continue;

        codec = ost->st->codec;//输出流的编解码器结构
        icodec = ist->st->codec;//输入流的编解码器结构

        //先把能复制的复制一下
        ost->st->disposition = ist->st->disposition;
        codec->bits_per_raw_sample = icodec->bits_per_raw_sample;
        codec->chroma_sample_location = icodec->chroma_sample_location;

        //如果只是复制一个流(不用解码后再编码),则把输入流的编码参数直接复制给输出流
        //此时是不需要解码也不需要编码的, 所以不需打开解码器和编码器
        if (ost->stream_copy)
        {
            //计算输出流的编解码器的extradata的大小,然后分配容纳extradata的缓冲
            //然后把输入流的编解码器的extradata复制到输出流的编解码器中
            uint64_t extra_size = (uint64_t) icodec->extradata_size
                    + FF_INPUT_BUFFER_PADDING_SIZE;

            if (extra_size > INT_MAX)    {
                return AVERROR(EINVAL);
            }

            /* if stream_copy is selected, no need to decode or encode */
            codec->codec_id = icodec->codec_id;
            codec->codec_type = icodec->codec_type;
```

```
            if (!codec->codec_tag){
                if (!oc->oformat->codec_tag
                    ||av_codec_get_id(oc->oformat->codec_tag,icodec->codec_tag) == codec->codec_id
                    ||av_codec_get_tag(oc->oformat->codec_tag,icodec->codec_id) <= 0)
                    codec->codec_tag = icodec->codec_tag;
            }

            codec->bit_rate = icodec->bit_rate;
            codec->rc_max_rate = icodec->rc_max_rate;
            codec->rc_buffer_size = icodec->rc_buffer_size;
            codec->extradata = av_mallocz(extra_size);
            if (!codec->extradata){
                return AVERROR(ENOMEM);
            }
            memcpy(codec->extradata, icodec->extradata, icodec->extradata_size);
            codec->extradata_size = icodec->extradata_size;

            //重新鼓捣一下time base(这家伙就是帧率)
            codec->time_base = ist->st->time_base;
            //如果输出文件是avi,做一点特殊处理
            if (!strcmp(oc->oformat->name, "avi"))    {
                if (copy_tb < 0
                        && av_q2d(icodec->time_base) * icodec->ticks_per_frame    >
