=====

前一阵子看了一下ffmpeg的源代码，并且做了一些注释，在此贴出来以作备忘。

本文分析一下ffmpeg注册复用器，编码器等的函数av_register_all()。该函数在所有基于ffmpeg的应用程序中几乎都是第一个被调用的。只有调用了该函数，才能使用复用器，编码器。

可见 **解复用器** 注册都是用

```
REGISTER_DEMUXER (X,x)
```

例如：

```
REGISTER_DEMUXER (AAC, aac)
```

可见 **复用器** 注册都是用

```
REGISTER_MUXER (X,x)
```

例如：

```
REGISTER_MUXER (ADTS, adts)
```

既有解复用器又有复用器 的话，可以用

```
REGISTER_MUXDEMUX (X,x);
```

例如：

```
REGISTER_MUXDEMUX (AC3, ac3);
```

我们来看一下宏的定义，这里以 **解复用器** 为例：

```
[cpp]
1. #define REGISTER_DEMUXER(X,x) { \
2.     extern AVInputFormat ff_###_demuxer; \
3.     if(CONFIG_###_DEMUXER) av_register_input_format(&ff_###_demuxer); }
```

注意：define里面的##可能不太常见，它的含义就是拼接两个字符串，比如

```
#define Conn(x,y) x##y
```

那么

```
int n = Conn(123,456); 结果就是n=123456;
```

我们以REGISTER_DEMUXER (AAC, aac)为例，则它等效于

```
[cpp]
1. extern AVInputFormat ff_aac_demuxer;
2. if(CONFIG_AAC_DEMUXER) av_register_input_format(&ff_aac_demuxer);
```

从上面这段代码我们可以看出，真正注册的函数是av_register_input_format(&ff_aac_demuxer)，那我就看看这个和函数的作用，查看一下av_register_input_format()的代码：

```
[cpp]
1. void av_register_input_format(AVInputFormat *format)
2. {
3.     AVInputFormat **p;
4.     p = &first_iformat;
5.     while (*p != NULL) p = &(*p)->next;
6.     *p = format;
7.     format->next = NULL;
8. }
```

这段代码是比较容易理解的，首先提一点，first_iformat是个什么东东呢？其实它是Input Format链表的头部地址，是一个全局静态变量，定义如下：

```
[cpp]
1. /** head of registered input format linked list */
2. static AVInputFormat *first_iformat = NULL;
```

由此我们可以分析出av_register_input_format()的含义，一句话概括就是：遍历链表并把当前的Input Format加到链表的尾部。至此REGISTER_DEMUXER (X, x)分析完毕。

同理，复用器道理是一样的，只是注册函数改为av_register_output_format()；

既有解复用器又有复用器的话，有一个宏定义：

```
[cpp]
1. #define REGISTER_MUXDEMUX(X,x) REGISTER_MUXER(X,x); REGISTER_DEMUXER(X,x)
```

可见是分别注册了复用器和解复用器。

此外还有网络协议的注册，注册函数为ffurl_register_protocol()，在此不再详述。

下面贴出它的源代码（allformats.c）

```
[cpp]
1. /*
2.  *雷霄骅
3.  *leixiaohua1020@126.com
4.  *中国传媒大学/数字电视技术
5.  */
6. /*
7.  * Register all the formats and protocols
8.  * Copyright (c) 2000, 2001, 2002 Fabrice Bellard

25.  */
26. #include "avformat.h"
27. #include "rtp.h"
28. #include "rdt.h"
29. #include "url.h"
30. //定义的宏？宏的速度会快一点？注册AVOutputFormat
31. //define中，用来把参数转换成字符串，##则用来连接前后两个参数，把它们变成一个字符串。
32. //感觉有点像Java中的EL，可以随意拼接字符串
33. #define REGISTER_MUXER(X,x) { \
34.     extern AVOutputFormat ff_##x##_muxer; \
35.     if(CONFIG_##X##_MUXER) av_register_output_format(&ff_##x##_muxer); }
36. //定义的宏？宏的速度会快一点？注册AVInputFormat
37. #define REGISTER_DEMUXER(X,x) { \
38.     extern AVInputFormat ff_##x##_demuxer; \
39.     if(CONFIG_##X##_DEMUXER) av_register_input_format(&ff_##x##_demuxer); }
40. //注册函数av_register_input_format
41.
42. //定义的宏？宏的速度会快一点？两个一起注册！
43. #define REGISTER_MUXDEMUX(X,x) REGISTER_MUXER(X,x); REGISTER_DEMUXER(X,x)
44. //定义的宏？宏的速度会快一点？注册URLProtocol
45. //extern URLProtocol ff_##x##_protocol;
46. //在librtmp中，对应的就是ff_rtmp_protocol
```

```

47. //这样就把librtmp整合起来了
48. //由此可见URLProtocol的名字是固定的
49. #define REGISTER_PROTOCOL(X,x) { \
50.     extern URLProtocol ff_###_protocol; \
51.     if(CONFIG_###_PROTOCOL) ffurl_register_protocol(&ff_###_protocol, sizeof(ff_###_protocol)); }
52. //注册函数ffurl_register_protocol
53. void av_register_all(void)
54. {
55.     static int initialized;
56.
57.     if (initialized)
58.         return;
59.     initialized = 1;
60.     //注册所有的codec
61.     avcodec_register_all();
62.     //注册所有的MUXER (复用器和解复用器)
63.     /* (de)muxers */
64.     REGISTER_MUXER    (A64, a64);
65.     REGISTER_DEMUXER  (AAC, aac);

297. REGISTER_PROTOCOL (TLS, tls);
298. REGISTER_PROTOCOL (UDP, udp);
299. }

```

整个代码没太多可说的，首先确定是不是已经初始化过了（initialized），如果没有，就调用avcodec_register_all()注册编解码器（这个先不分析），然后就是注册，注册，注册...直到完成所有注册。

PS：曾经研究过一阵子RTMP协议，以及对应的开源工程librtmp。在这里发现有一点值得注意，ffmpeg自带了RTMP协议的支持，只有使用 rtmtpt://, rtmpe://, rtmpte://等的时候才会使用librtmp库。

函数调用关系图如下图所示。av_register_all()调用了avcodec_register_all()。avcodec_register_all()注册了和编解码器有关的组件：硬件加速器，解码器，编码器，Parser，Bitstream Filter。av_register_all()除了调用avcodec_register_all()之外，还注册了复用器，解复用器，协议处理器。

下面附上复用器，解复用器，协议处理器的代码。

注册复用器的函数是av_register_output_format()。

```

1. void av_register_output_format(AVOutputFormat *format)
2. {
3.     AVOutputFormat **p;
4.     p = &first_oformat;
5.     while (*p != NULL) p = &(*p)->next;
6.     *p = format;
7.     format->next = NULL;
8. }
  
```

注册解复用器的函数是av_register_input_format()。

```

1. void av_register_input_format(AVInputFormat *format)
2. {
3.     AVInputFormat **p;
4.     p = &first_ifformat;
5.     while (*p != NULL) p = &(*p)->next;
6.     *p = format;
7.     format->next = NULL;
8. }
  
```

注册协议处理器的函数是ffurl_register_protocol()。

```

1. int ffurl_register_protocol(URLProtocol *protocol)
2. {
3.     URLProtocol **p;
4.     p = &first_protocol;
5.     while (*p)
6.         p = &(*p)->next;
7.     *p = protocol;
8.     protocol->next = NULL;
9.     return 0;
10. }
  
```
