FFmpeg 的 H.264 解码器源代码简单分析：概述

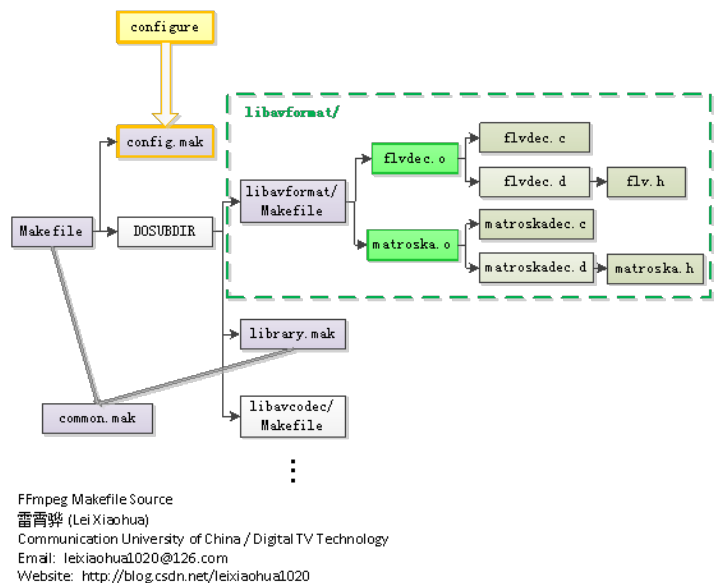

本文记录FFmpeg的Makefile的源代码。Makefile用于编译FFmpeg的源代码。通过分析Makefile文件，可以了解FFmpeg的源代码生成的流程。有关Makefile这部分我本身基础不算很牢，很多地方还在慢慢摸索，所以分析的内容不能保证完全准确。以后有时间和其他朋友多交流再慢慢完善这篇文章。

PS：make有一个很有用的命令：“make -n”。该选项会显示命令，但不会执行命令，十分有助于分析Makefile

## FFmpeg中与Makefile相关的文件

- FFmpeg中与Makefile相关的文件主要有以下几个：
- 根目录Makefile：最基本的Makefile；
  - config.mak：由configure生成的Makefile，保存了Configure的设置信息；
  - libavXXXX/Makefile：每个类库的Makefile（仅仅设置了几个变量）；
  - library.mak：编译类库的Makefile（和libavXXXX/Makefile配合使用）；
  - common.mak：包含一些通用代码的Makefile；

它们之间的关系如下图所示。

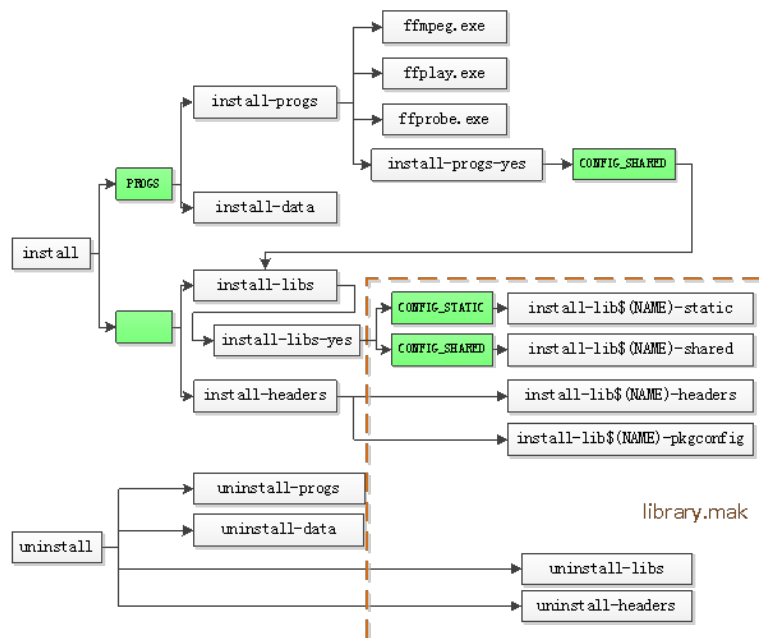

图中除了画出了Makefile之外，还画出了和Makefile有关的一些文件：

- XXX.c：C语言文件；
- XXX.h：C语言文件用到的头文件；
- XXX.o：C语言文件对应的目标文件；
- XXX.d：C语言文件对应的依赖关系文件；

## Make Install 之间的关系

简单分析一下Makefile中的make install之间的关系，如下图所示（使用的是MinGW编译器）。

FFmpeg Makefile Source: install  
 雷霄骅 (Lei Xiaohua)  
 Communication University of China / Digital TV Technology  
 Email: leixiaohua1020@126.com  
 Website: <http://blog.csdn.net/leixiaohua1020>

从图中可以看出，install伪目标依赖于4个伪目标：

- install-progs：安装应用程序ffmpeg.exe，ffplay.exe，ffprobe.exe；
- install-data：安装数据（\*.ffpreset之类的文件，没研究过）
- install-libs：安装类库（libavcodec.dll等文件）
- install-headers：安装头文件（libavcodec/avcodec.h等文件）

install-progs依赖于ffmpeg.exe，ffplay.exe，ffprobe.exe以及install-progs-yes伪目标。在CONFIG\_SHARED取值为yes的情况下，install-progs-yes依赖于install-libs。

install-libs依赖于伪目标install-libs-yes。install-libs-yes的依赖关系位于library.mak文件中。如果CONFIG\_STATIC取值为yes，install-libs-yes依赖于install-lib\$(NAME)-static（其中\$(NAME)为类库文件名，例如avformat）；如果CONFIG\_SHARED取值为yes，install-libs-yes依赖于install-lib\$(NAME)-shared。install-headers依赖于伪目标install-lib\$(NAME)-headers和install-lib\$(NAME)-pkgconfig。

和install相对应，uninstall伪目标依赖于4个伪目标：

- uninstall-progs：卸载应用程序；
- uninstall-data：卸载数据；
- uninstall-libs：卸载类库；
- uninstall-headers：卸载头文件；

其中uninstall-libs和uninstall-headers的依赖关系位于library.mak中。

## 根目录Makefile

根目录Makefile是最重要的。简单注释过的Makefile如下所示。

根目录Makefile代码一开始的时候包含了config.mak文件。这个文件是运行./configure的后生成的配置文件，包含了所有的配置信息。

随后代码定义了ffplay.exe, ffmpeg.exe, ffprobe.exe与ffplay\_g.exe, ffmpeg\_g.exe, ffprobe\_g.exe的依赖关系。然后定义了ffplay\_g.exe, ffmpeg\_g.exe, ffprobe\_g.exe与libavformat, libavcodec等这些类库的依赖关系。

根目录Makefile中也定义了all, install, uninstall, clean等等一系列的伪目标，这样可以通过给Makefile指定不同的目标来完成不同的事。

此外根目录的Makefile中有一个很重要的命令包DOSUBDIR。在该命令包通过包含libavXXX/Makefile和library.mak等文件，定义了FFmpeg类库（例如libavformat, libavcodec, libavutil等）的依赖关系。

## config.mak

473.  endif # FFMPEG_CONFIG_MAK

```

config.mak代码大致可以分为以下几类信息：

- (1) 各种路径（prefix等）
- (2) 工具集（arch、cc、ld、yasm等）
- (3) 参数集（cppflag、cflag、ldflag等）
- (4) 前缀后缀（.a、.dll、.exe等）
- (5) 类库版本（libavXXX\_version信息）
- (6) 组件配置。这一部分信息使用{组件名}=yes的方式进行书写。对于不支持的组件，则在该组件所在行的前面标记上“！”号（感叹号似乎在Makefile语法中并没有什么特殊的用意，此处可能仅仅是作为一种标记？）。这一部分可以分为3类信息：
  - a) ARCH\_信息
  - b) HAVE\_信息
  - c) CONFIG\_信息。这一部分内容最多，将近有1000行。
- (7) Test信息（测试组件的结果？还没研究）

## libavXXXX/Makefile

libavXXXX/Makefile指的是FFmpeg类库（libavformat、libavcodec、libavutil等）所在的文件夹下的Makefile。例如libavformat文件夹下的Makefile代码如下所示。

```

[python]
1.  # Ffmpeg Libavformat Makefile
2.  #
3.  # 注释：雷霄骅
4.  # leixiaohua1020@126.com
5.  # http://blog.csdn.net/leixiaohua1020
6.  #
7.  # Ffmpeg中libavformat的Makefile。
8.  # 注意该Makefile并没有定义类库的编译规则（这一部分统一在library.mak中完成）。
9.  # 该Makefile中只是赋值了几个重要的字符串：
10. #     NAME, FFLIBS, HEADERS, OBJS, OBJS-yes
11.
12. #重要：包含了configure信息，位于上一级目录
13. include $(SUBDIR)../config.mak
14. #名称
15. NAME = avformat
16. #用到的库？
17. FFLIBS = avcodec avutil
18. #SDK中的头文件

从代码可以看出，libavformat文件下的Makefile的规则十分简单，并不包含文件之间的依赖关系（依赖关系位于library.mak中），仅仅是设置了几个变量的值：

NAME：类库名称。注意不包含类库前面的“lib”以及类库的后缀。在这里是“avformat”。

FFLIBS：该类库依赖的类库名称。在这里用到了“avcodec”和“avutil”。

HEADERS：该类库导出的头文件。在这里是“avformat.h”，“avio.h”，“version.h”。

OBJS：该类库依赖的目标文件（必须的）。在这里是“utils.o”等等。

OBJS-yes：该类库依赖的目标文件（可选的）。在这里是“flvdec.o”、“flvenc.o”等等。

## library.mak

library.mak专门用于存储编译类库的规则，是和libavXXX/Makefile配合使用的。它的源代码如下所示。

```

library.mak代码中首先包含了common.mak文件。这个文件定义了通用的一些编译规则。然后定义了类库的依赖关系。

此外library.mak中也定义了install-headers，install-lib\$(NAME)-shared，install-lib\$(NAME)-static，install-lib\$(NAME)-headers，clean等等一系列的伪目标（NAME取值avformat、avcodec等）。这些目标主要配合根目录的Makefile使用。
