IOS程序使用FFmpeg类库的说明

IOS应用程序使用FFmpeg类库的流程如下所示。

1.

编译FFmpeg类库

编译IOS的FFmpeg类库需要支持5种架构:armv7、armv7s、arm64、i386、x86_64。其中前面3个是给真机使用的,后面2个是给模拟器使用的。本文记录的FFmpeg 类库还支持第三方类库libx264和libfaac,所以在编译之前还要先编译libx264和libfaac的源代码。总体说来,IOS下的类库需要编译成两个版本:thin和fat。每种架构对 应一个thin版本的类库,将这些不同架构thin版本的类库合成起来之后,就形成了fat版本的类库。下面简单记录一下编译步骤。编译过程中IOS SDK版本为8.3,FFmpe g版本为2.7.1,faac和x264分别使用了最新版本的源代码。

(1) 第三方库libx264的编译

这一步用于生成支持armv7、armv7s、arm64、i386、x86_64几种架构的fat版本的libx264.a。下面这个脚本可以首先编译生成上面5种架构的thin版本的libx264.a,分成5个文件夹存储于thin-x264文件夹中;然后将这些类库合并成为1个fat版本的libx264.a,存储于fat-x264文件夹中。

(8) 打包类库

这一步用于将上述步骤中生成的5个版本的FFmpeg打包生成fat版本的FFmpeg类库。这一步骤执行完毕后,将thin-ffmpeg中几个thin版本的类库合并为一个fat版本的类库,并存储于fat-ffmpeg文件夹中。脚本如下所示。

build_ffmpeg_fat.sh

```
[plain] 📳 📑
      #!/bin/sh
2.
3.
4.
      # directories
      THIN=`pwd`/"thin-ffmpeg"
5.
      FAT=`pwd`/"fat-ffmpeg"
6.
      CWD=`pwd`
8.
     # must be an absolute path
9.
10.
11.
      ARCHS="armv7s i386 armv7 arm64 x86 64'
12.
13.
14.
      echo "building fat binaries..."
15.
16.
      mkdir -p $FAT/lib
17.
      set - $ARCHS
18.
      cd thin-ffmpeg/$1/lib
19.
      for LIB in *.a
20.
      cd $CWD
21.
22.
     lipo -create `find $THIN -name $LIB` -output $FAT/lib/$LIB
23.
      done
24.
25.
      cd $CWD
26. cp -rf $THIN/$1/include $FAT
```

生成完fat版本的类库后,可以在命令行使用lipo命令查看类库的架构,如下所示。

```
[plain] [ ]

1. lipo -info libavcodec.a
```

2.

编写IOS程序

编写包含FFmpeg类库支持的IOS程序分成两步:配置Xcode环境,编写C语言代码。

(1) 配置Xcode环境

下面以Xcode的IOS中的Single View Application为例,记录一下配置步骤:

(a)

拷贝头文件所在的include文件夹和fat版本的FFmpeg类库(包括libavformat.a,libavcodec.a,libavutil.a,libavdevice.a,libavfilter.a,libpo stproc.a,libswresample.a,libswscale.a;以及第三方fat版本类库libx264.a,libfaac.a)至项目文件夹。并将它们添加至项目中。

(b)

项目属性->Build Settings中配置以下3个选项。 Linking->Other Linker Flags中添加下面内容:

Search Paths->Header Search Paths添加下面内容

```
1. $(PROJECT_DIR)/include
```

Search Paths->Library Search Paths添加下面内容

```
[plain]  

(PROJECT_DIR)
```

其它的一些配置。这些配置随着FFmpeg版本的不同而有略微的不同(在某些情况下也可能不需要配置)。我目前使用的2.7.1版本的FFmpeg需要配置下面的选项。项目属性->General->Linked Frameworks and Libraries中添加两个类库:AVFoundation.framework和libz.dylib。

(2) 编写C语言代码

做好上面配置后,就可以在项目中编写代码测试一下FFmpeg是否正确配置了。由于IOS使用的Objective-C是兼容C语言的,所以可以直接写C语言代码调用FFmpeg。

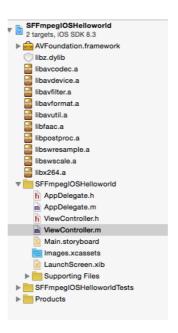

可以在ViewController.m中的viewDidLoad()函数中添加一行printf()代码打印FFmpeg类库的版本信息,如下所示。

```
[objc] 📄 📑
      #import "ViewController.h"
 1.
 2.
      #include <libavcodec/avcodec.h>
 3.
 4.
      @interface ViewController ()
 5.
 6.
 8.
      @implementation ViewController
 9.
10.
      - (void)viewDidLoad {
11.
           [super viewDidLoad]:
         // Do any additional setup after loading the view, typically from a nib.
12.
13.
           printf(\hbox{\tt "\$s",avcodec\_configuration());}\\
14.
15.
16.
       - (void)didReceiveMemoryWarning {
17.
           [super didReceiveMemoryWarning];
18.
          // Dispose of any resources that can be recreated.
19.
      }
20.
21.
```

如果类库编译无误,启动IOS程序的时候会在控制台打印版本信息。

运行结果

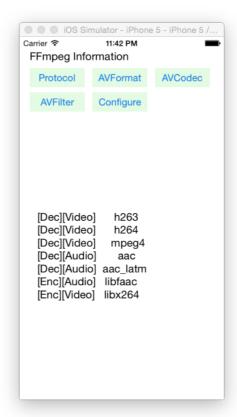

App在手机上运行后的结果如下图所示。

单击"AVFormat"按钮内容如下所示。

单击"Configure"按钮即为程序开始运行时候的内容。

本解决方案包含了使用FFmpeg在移动端处理多媒体的各种例子:

[Android]

simplest_android_player: 基于安卓接口的视频播放器

simplest_ffmpeg_android_helloworld: 安卓平台下基于FFmpeg的HelloWorld程序

simplest_ffmpeg_android_decoder: 安卓平台下最简单的基于FFmpeg的视频解码器

simplest ffmpeg android decoder onelib: 安卓平台下最简单的基于FFmpeg的视频解码器-单库版

simplest_ffmpeg_android_streamer: 安卓平台下最简单的基于FFmpeg的推流器

simplest_ffmpeg_android_transcoder: 安卓平台下移植的FFmpeg命令行工具

simplest_sdl_android_helloworld: 移植SDL到安卓平台的最简单程序

[IOS]

simplest_ios_player: 基于IOS接口的视频播放器

simplest_ffmpeg_ios_helloworld: IOS平台下基于FFmpeg的HelloWorld程序

simplest_ffmpeg_ios_decoder: IOS平台下最简单的基于FFmpeg的视频解码器

simplest_ffmpeg_ios_streamer: IOS平台下最简单的基于FFmpeg的推流器

simplest_ffmpeg_ios_transcoder: IOS平台下移植的ffmpeg.c命令行工具
