🕟 XBMC源代码分析 6:视频播放器(dvdplayer)-文件头(以ffmpeg为例)

2014年01月09日 00:28:26 阅读数:7123

XBMC分析系列文章:

XBMC源代码分析 1:整体结构以及编译方法

XBMC源代码分析 2:Addons (皮肤Skin)

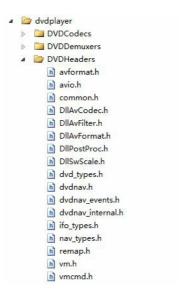

XBMC源代码分析 3:核心部分(core)-综述

XBMC源代码分析 4:视频播放器(dvdplayer)-解码器(以ffmpeg为例)

XBMC源代码简析 5:视频播放器(dvdplayer)-解复用器(以ffmpeg为例)

本文我们分析XBMC中视频播放器(dvdplayer)中的文件头部分。文件头部分里包含的是封装Dll用到的头文件。由于文件头种类很多,不可能一一分析,因此还是以ffmpeg文件头为例进行分析。

XBMC中文件头部分文件目录结构如下图所示。

在这里我们看一下封装AVCodec和AVFormat结构体的头文件,分别是DIIAvCodec.h和DIIAvFormat.h。

DIIAvFormat.h内容如下。其中包含了2个主要的类:DIIAvFormatInterface和DIIAvFormat。

其中DllAvFormatInterface是一个纯虚类,里面全是纯虚函数。

DllAvFormat中包含很多已经定义过的宏,稍后我们分析一下这些宏的含义。

```

    DEFINE_FUNC_ALIGNED2(result, linkage, name, t1, t2) 定义一个方法(2个参数)
10.
11.
    以此类推...
```

从定义中可以看出,调用了m_dll的方法ResolveExport()。但是在DllAvFormat中并没有m_dll变量。实际上m_dll位于DllAvFormat的父类DllDynamic里面。

DllAvFormat继承了DllDynamic。DllDynamic是用于加载Dll的类。我们可以看一下它的定义:

```
[cpp] 📳 📑
1.
      //Dll动态加载类
2.
     class DllDynamic
3.
     public:
4.
       DllDynamic();
5.
     DllDynamic(const CStdString& strDllName);
6.
       virtual ~DllDynamic();
7.
     virtual bool Load();//加载
8.
       virtual void Unload();//卸载
9.
     virtual bool IsLoaded() const { return m_dll!=NULL; }//是否加载
10.
11.
       bool CanLoad();
     bool EnableDelayedUnload(bool b0n0ff);
12.
13.
       bool SetFile(const CStdString& strDllName);//设置文件
14.
     const CStdString &GetFile() const { return m_strDllName; }
15.
16.
     protected:
       virtual bool ResolveExports()=0;
17.
18.
       virtual bool LoadSymbols() { return false; }
19.
       bool m_DelayUnload;
      LibraryLoader* m dll;
20.
21.
       CStdString m_strDllName;
22. };
```

其中有一个变量LibraryLoader* m_dll。是用于加载Dll的。

可以看一DIIDynamic中主要的几个函数,就能明白这个类的作用了。

```
[cpp] 📳 📑
 1.
      //加载
 2.
      bool DllDynamic::Load()
 3.
      {
 4.
 5.
          return true;
 6.
        if (!(m dll=CSectionLoader::LoadDLL(m strDllName, m DelayUnload, LoadSymbols())))
 7.
      return false;
 8.
9.
10.
     if (!ResolveExports())
11.
      CLog::Log(LOGERROR, "Unable to resolve exports from dll %s", m_strDllName.c_str());
12.
13.
          Unload();
14.
         return false;
15.
16.
17.
        return true;
18. }
```

```
1. //卸载
2. void DllDynamic::Unload()
3. {
4. if(m_dll)
5. CSectionLoader::UnloadDLL(m_strDllName);
6. m_dll=NULL;
7. }
```

可以看看LibraryLoader的定义。LibraryLoader本身是一个纯虚类,具体方法的实现在其子类里面。

```
[cpp] 📳 📑
      //Dll加载类
 2.
      class LibraryLoader
 3.
 4.
      public:
        LibraryLoader(const char* libraryFile);
 5.
 6.
       virtual ~LibraryLoader();
 7.
 8.
       virtual bool Load() = 0;
        virtual void Unload() = 0;
 9.
10.
        virtual int ResolveExport(const char* symbol, void** ptr, bool logging = true) = 0;
11.
        virtual int ResolveOrdinal(unsigned long ordinal, void** ptr);
12.
13.
        virtual bool IsSystemDll() = 0;
14.
        virtual HMODULE GetHModule() = 0;
15.
        virtual bool HasSymbols() = 0;
16.
17.
        char* GetName(); // eg "mplayer.dll"
18.
        char* GetFileName(); // "special://xbmcbin/system/mplayer/players/mplayer.dl
19.
        char* GetPath(); // "special://xbmcbin/system/mplayer/players/"
20.
21.
        int IncrRef();
22.
      int DecrRef();
23.
        int GetRef();
24.
25.
      private:
26.
       LibraryLoader(const LibraryLoader&);
        LibraryLoader& operator=(const LibraryLoader&);
27.
       char* m_sFileName;
28.
29.
        char* m_sPath;
      int m_iRefCount;
30.
31. };
```

LibraryLoader的继承关系如下图所示。

由于自己的操作系统是Windows下的,因此可以看看Win32DllLoader的定义。

```
[cpp] 📳 📑
      //Windows下的Dll加载类
 1.
 2.
      class Win32DllLoader : public LibraryLoader
 3.
 4.
      public:
        class Import
 6.
 7.
        public:
      void *table;
 8.
          DWORD function;
 9.
10.
11.
      Win32DllLoader(const char *dll);
12.
13.
        ~Win32DllLoader();
14.
15.
        virtual bool Load()://加载
16.
        virtual void Unload();//卸载
17.
18.
        virtual int ResolveExport(const char* symbol, void** ptr, bool logging = true);
19.
        virtual bool IsSystemDll();
20.
        virtual HMODULE GetHModule();
21.
        virtual bool HasSymbols();
22.
23.
24.
        void OverrideImports(const CStdString &dll);
25.
        void RestoreImports();
        static bool ResolveImport(const char *dllName, const char *functionName, void **fixup);
26.
        static bool ResolveOrdinal(const char *dllName, unsigned long ordinal, void **fixup);
27.
        bool NeedsHooking(const char *dllName);
28.
29.
30.
        HMODULE m_dllHandle;
31.
        bool bIsSystemDll;
32.
33.
        std::vector<Import> m_overriddenImports;
34.
        std::vector<HMODULE> m_referencedDlls;
35. };
```

其中加载DII使用Load(),卸载DII使用Unload()。可以看看这两个函数具体的代码。

```
[cpp]
      //加载
2.
      bool Win32DllLoader::Load()
3.
4.
       if (m_dllHandle != NULL)
5.
          return true;
6.
        //文件路径
        CStdString strFileName = GetFileName();
7.
8.
        CStdStringW strDllW;
9.
        g_charsetConverter.utf8ToW(CSpecialProtocol::TranslatePath(strFileName), strDllW, false, false, false);
10.
11.
        //加载库
        \verb|m_dllhandle| = \verb|LoadLibraryExW(strDllW.c_str()|, \verb|NULL|, \verb|LOAD_WITH_ALTERED_SEARCH_PATH|)|; \\
12.
13.
        if (!m_dllHandle)
14.
15.
          LPVOID lpMsgBuf;
      DWORD dw = GetLastError();
16.
17.
18.
         FormatMessage(FORMAT_MESSAGE_ALLOCATE_BUFFER | FORMAT_MESSAGE_FROM_SYSTEM | FORMAT_MESSAGE_IGNORE_INSERTS, NULL, dw, 0, (LPTSTR)
       &lpMsgBuf, 0, NULL );
19.
          CLog::Log(LOGERROR, "%s: Failed to load %s with error %d:%s", __FUNCTION__, CSpecialProtocol::TranslatePath(strFileName).c_str(),
      dw, lpMsgBuf);
      LocalFree(lpMsgBuf);
20.
21.
          return false;
22.
23.
      // handle functions that the dll imports
24.
        if (NeedsHooking(strFileName.c str()))
25.
26.
       OverrideImports(strFileName);
27.
        else
28.
         bIsSystemDll = true;
29.
30.
31.
32.
      //卸载
33.
      void Win32DllLoader::Unload()
34.
     {
35.
        // restore our imports
        RestoreImports();
36.
37.
        //卸载库
      if (m_dllHandle)
38.
39.
40.
         if (!FreeLibrary(m_dllHandle))
             CLog::Log(LOGERROR, "%s Unable to unload %s", __FUNCTION__, GetName());
41.
42.
43.
44.
      m_dllHandle = NULL;
45.
```
