🖲 ffdshow 源代码分析 7: libavcodec视频解码器类(TvideoCodecLibavcodec)

2013年11月12日 00:36:32 阅读数:6552

ffdshow源代码分析系列文章列表:

ffdshow 源代码分析 1: 整体结构

ffdshow 源代码分析 2: 位图覆盖滤镜(对话框部分Dialog)

ffdshow 源代码分析 3: 位图覆盖滤镜(设置部分Settings)

ffdshow 源代码分析 4: 位图覆盖滤镜(滤镜部分Filter)

ffdshow 源代码分析 5: 位图覆盖滤镜(总结)

ffdshow 源代码分析 6: 对解码器的dll的封装 (libavcodec)

ffdshow 源代码分析 7: libavcodec视频解码器类(TvideoCodecLibavcodec)

ffdshow 源代码分析 8: 视频解码器类(TvideoCodecDec)

ffdshow 源代码分析 9: 编解码器有关类的总结

前文已经介绍了ffdshow中对libavcodec封装的类Tlibavcodec:

ffdshow 源代码分析 6: 对解码器的dll的封装 (libavcodec)

在这里我们进一步介绍一下其libavcodec解码器类。注意前一篇文章介绍的类Tlibavcodec仅仅是对libavcodec所在的"ffmpeg.dll"的函数进行封装的类。但Tlibavcodec并不是一个解码器类,其没有继承任何类,还不能为ffdshow所用。本文介绍的TvideoCodecLibavcodec才是libavcodec解码器类,其继承了TvideoCodecDec。

先来看一看TvideoCodecLibavcodec的定义吧,位于codecs-> TvideoCodecLibavcodec.h中。

```

```

这里有一个类TlibavcodecExt,我觉得应该是扩展了Tlibavcodec的一些功能,在这里我们先不管它,直接看看TvideoCodecLibavcodec都包含了什么变量:

Tlibavcodec *libavcodec:该类封装了libavcodec的各种函数,在前一篇文章中已经做过介绍,在此不再重复叙述了。可以认为该变量是TvideoCodecLibavcodec类的灵魂,所有libavcodec中的函数都是通过该类调用的。

AVCodec *avcodec:FFMPEG中的结构体,解码器

AVCodecContext *avctx:FFMPEG中的结构体,解码器上下文

AVFrame *frame FFMPEG中的结构体,视频帧 mutable char_t codecName[100]:解码器名称

FOURCC fcc: FourCC

Textradata *extradata: 附加数据

...

再来看一下TvideoCodecLibavcodec都包含什么方法:

create():创建解码器的时候调用

getDuration():获得时长 getExtradata():获得附加数据 drawMV():画运动矢量

getEncoderInfo():获得编码器信息

此外还包括一些有关解码的方法【这个是最关键的】:

beginDecompress():解码初始化

decompress():解码

下面我们来详细看看这些函数的实现吧:

先来看一下TvideoCodecLibavcodec的构造函数:

```
[cpp] 📳 🔝
      //libavcodec解码器(视频)
     //内容大部分都很熟悉,因为是FFmpeg的API
2.
     TvideoCodecLibavcodec::TvideoCodecLibavcodec(IffdshowBase *Ideci, IdecVideoSink *IsinkD):
3.
4.
        Tcodec(Ideci), TcodecDec(Ideci, IsinkD),
5.
         TvideoCodec(Ideci),
     TvideoCodecDec(Ideci, IsinkD),
6.
         TvideoCodecEnc(Ideci, NULL).
7.
     h264RandomAccess(this),
8.
9.
         bReorderBFrame(true)
10.
     {
11.
         create():
12.
```

```
[cpp] 📳 📑
      void TvideoCodecLibavcodec::create(void)
 2.
     {
 3.
         ownmatrices = false;
     deci->getLibavcodec(&libavcodec);
 4.
         ok = libavcodec ? libavcodec->ok : false;
 5.
     avctx = NULL;
 6.
         avcodec = NULL;
 7.
     frame = NULL;
8.
         quantBytes = 1;
 9.
    statsfile = NULL;
10.
11.
         threadcount = 0;
     codecinited = false;
12.
13.
         extradata = NULL;
     theorart = false;
14.
15.
         ffbuf = NULL;
     ffbuflen = 0;
16.
         codecName[0] = '\0';
17.
     ccDecoder = NULL;
18.
19.
         autoSkipingLoopFilter = false;
20.
     inPosB = 1;
21.
         firstSeek = true;
     mpeg2 new sequence = true;
22.
23.
         parser = NULL;
24. }
```

从Create()函数我们可以看出,其完成了各种变量的初始化工作。其中有一行代码:

完成了Tlibavcodec*libavcodec的初始化工作。

再来看几个函数。

getDuration(),用于从AVCodecContext中获取时长:

```
[cpp] 📳 📑
     REFERENCE_TIME TvideoCodecLibavcodec::getDuration()
1.
2.
3.
         REFERENCE_TIME duration = REF_SECOND_MULT / 100;
4.
     if (avctx && avctx->time_base.num && avctx->time_base.den) {
5.
             duration = REF_SECOND_MULT * avctx->time_base.num / avctx->time_base.den;
6.
           if (codecId == AV_CODEC_ID_H264) {
                duration *= 2;
8.
9.
     if (duration == 0) {
10.
             return REF_SECOND_MULT / 100;
11.
12.
13.
         return duration:
14.
```

getExtradata()用于从AVCodecContext中获取附加信息:

```
bool TvideoCodecLibavcodec::getExtradata(const void* *ptr, size_t *len)
1.
2.
     {
3.
         if (!avctx || !len) {
4.
             return false;
5.
     *len = avctx->extradata_size;
6.
     if (ptr) {
    *ptr = avctx->extradata;
7.
8.
9.
10.
         return true;
11. }
```

drawMV()用于从AVFrame中获取运动矢量信息,并画出来(这个函数用于一个名为"可视化"的滤镜里面,用于显示视频的运动矢量信息)。

```
[cpp] 📳 📑
      //画出运动矢量
2.
      bool TvideoCodecLibavcodec::drawMV(unsigned char *dst, unsigned int dstdx, stride_t stride, unsigned int dstdy) const
3.
4.
          if (!frame->motion_val || !frame->mb_type || !frame->motion_val[0]) {
5.
               return false;
6.
7.
8.
      #define IS 8X8(a) ((a)&MB TYPE 8x8)
      #define IS 16X8(a) ((a)&MB TYPE 16x8)
9.
      #define IS_8X16(a) ((a)&MB_TYPE 8x16)
10.
      #define IS_INTERLACED(a) ((a)&MB TYPE INTERLACED)
11.
            \# define \ USES\_LIST(a, \ list) \ ((a) \ \& \ ((MB\_TYPE\_P0L0|MB\_TYPE\_P1L0) << (2*(list))))      
12.
13.
      const int shift = 1 + ((frame->play_flags & CODEC_FLAG_QPEL) ? 1 : 0);
const int mv_sample_log2 = 4 - frame->motion_subsample_log2;
14.
15.
      const int mv_stride = (frame->mb_width << mv_sample_log2) + (avctx->codec_id == AV_CODEC_ID_H264 ? 0
16.
17.
          int direction = \theta;
18.
19.
           int mulx = (dstdx << 12) / avctx->width;
20.
      int muly = (dstdy << 12) / avctx->height;
21.
          //提取两个方向上的运动矢量信息(根据不同的宏块划分,可以分成几种情况)
      //在AVCodecContext的motion val中
22.
23.
          for (int mb_y = 0; mb_y < frame->mb_height; mb_y++)
          for (int mb_x = 0; mb_x < frame->mb_width; mb_x++) {
24.
                   const int mb_index = mb_x + mb_y * frame->mb_stride;
25.
26.
                  if (!USES_LIST(frame->mb_type[mb_index], direction)) {
27.
                       continue:
28.
29.
                   ...此处代码太长,略
30.
31.
      #undef IS_8X8
32.
      #undef IS 16X8
33.
      #undef IS_8X16
34.
      #undef IS_INTERLACED
35.
      #undef USES_LIST
36.
         return true;
37.
```

下面来看几个很重要的函数,这几个函数继承自TvideoCodecDec类。

beginDecompress()用于解码器的初始化。注:这个函数的代码太长了,因此只选择一点关键的代码。

```
[cpp] 📳 📑
             decompression -----
 2.
      bool TvideoCodecLibavcodec::beginDecompress(TffPictBase &pict, FOURCC fcc, const CMediaType &mt, int sourceFlags)
3.
 4.
          palette_size = 0;
          prior_out_rtStart = REFTIME_INVALID;
 5.
6.
         prior_out_rtStop = 0;
          rtStart = rtStop = REFTIME INVALID;
7.
      prior in rtStart = prior in rtStop = REFTIME INVALID;
8.
          mpeg2_in_doubt = codecId == AV_CODEC_ID_MPEG2VIDEO;
9.
10.
11.
          int using dxva = 0;
12.
13.
          int numthreads = deci->getParam2(IDFF_numLAVCdecThreads);
14.
     int thread_type = 0;
15.
          if (numthreads > 1 && sup_threads_dec_frame(codecId)) {
16.
             thread_type = FF_THREAD_FRAME;
17.
          } else if (numthreads > 1 && sup_threads_dec_slice(codecId)) {
           thread_type = FF_THREAD_SLICE;
18.
19.
20.
21.
          if (numthreads > 1 && thread_type != 0) {
22.
           threadcount = numthreads;
23.
          } else {
24.
           threadcount = 1;
25.
26.
          if (codecId == CODEC ID H264 DXVA) {
27.
      codecId = AV_CODEC_ID_H264;
28.
29.
              using_dxva = 1;
30.
         } else if (codecId == CODEC_ID_VC1_DXVA) {
31.
              codecId = AV_CODEC_ID_VC1;
32.
              using dxva = 1;
33.
34.
35.
          avcodec = libavcodec->avcodec_find_decoder(codecId);
36.
     if (!avcodec) {
37.
             return false;
38.
          avctx = libavcodec->avcodec alloc context(avcodec, this);
39.
     avctx->thread type = thread type;
40.
41.
          avctx->thread count = threadcount:
42.

84.
      extradata = new Textradata(mt, FF_INPUT_BUFFER_PADDING SIZE);
85.
     此处代码太长,略...
86.
87.
     }
```

从代码中可以看出这个函数的流程是:

```
1.avcodec_find_decoder();
2.avcodec_alloc_context();
3.avcodec_alloc_frame();
4.avcodec_open();
```

主要做了libavcodec初始化工作。

begin decompress()用于解码器的初始化。 注:这个函数的代码太长了,因此只选择一点关键的代码。

```
[cpp] 🗐 🐧
 1.
      HRESULT TvideoCodecLibavcodec::decompress(const unsigned char *src, size_t srcLen0, IMediaSample *pIn)
 2.
      {
3.
          代码太长,略...
4.
          AVPacket avpkt;
5.

86.
87.
88.
                       } else {
89.
                           used_bytes = libavcodec->avcodec_decode_video2(avctx, frame, &got_picture, &avpkt);
90.
91.
              }
92.
           代码太长,略...
93.
94.
```

从代码中可以看出这个函数的流程是:

1.AVPacket avpkt;

2.av_init_packet();

3.avcodec_decode_video2();

和ffmpeg的解码流程相差不大。
